

Getting Started With PureMark

Mayitreya Pasumarthu

2026/05/11

First Thing's First, the Toolbar

This is the toolbar:

This is a Heading

On PureMark, this is how you make a heading. You can write text below the heading.

You can start a new paragraph just by pressing ENTER a couple times and starting a new sentence!

This is a Subheading

On PureMark, this is how you make a subheading. You can write text below the subheading, and it will automatically be a child of the closest heading above it.

Adding a page break to the document is as simple as clicking the **Insert > Page Break** button on the toolbar! It will add two `clearpage` commands to wherever your cursor is. This indicates that a page break has been added.

Basic Text Features

You can make an ordered list just by starting a line with 1. (notice how there's a space after the period).

1. This is
2. an ordered
3. list

You can even make unordered lists by clicking the **Insert > List > Bulleted List** button on the toolbar.

- This is
- a bulleted
- list

This text is **bold**

This text is *italic*

This text is monospaced

This text is underlined

Math

You can add math expressions by clicking the “Math” icon in the toolbar. By default, it will add an “in-line expression” (a math expression that’s part of the sentence). For example, this is the variable x and this is the expression e^x .

You can also add math on its own block using double dollar signs, as such:

$$E = MC^2$$

Or even really hard looking equations, using the built in equation editor:

$$\oint_{\partial\Omega} \mathcal{F} \cdot d\mathbf{s} = \lim_{n \rightarrow \infty} \sum_{k=1}^n \left[\frac{\nabla \times \Psi(\xi_k)}{\sqrt{1 - \frac{v^2}{c^2}}} \right] \otimes \int_0^\infty \frac{e^{-st} \cdot \Gamma(z)}{\zeta(s + i\tau)} dt$$

By the way, adding links is as easy as clicking the **Insert > Hyperlink** button in the toolbar.

Code

Code can be embedded as such, including syntax highlighting (on the PDF output by specifying the language):

```
def main():  
    print("Hello, World!")
```

```
main()
```

There’s an **Insert > Code** button in the toolbar as well!

Images

Adding images is as simple as clicking the **Insert > Image** button in the toolbar, uploading your image, giving it a name and (optional) description, and inserting the image.

PureMark will do its best to accommodate your image wherever your cursor currently is, and a reference to the image will be added to the bottom of your PureMark document. However, you’re also able to control the size of images within the image importer.

Here's a (small) cute picture of a cat!

cat

Figure 1: cat

Tables

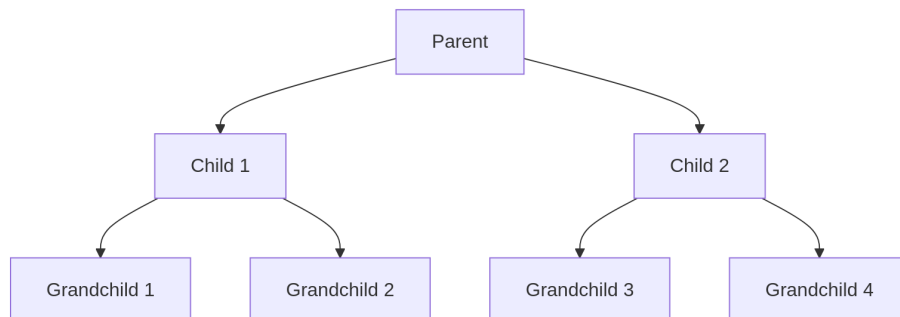

Tables are incredibly easy to add. Just click the **Insert > Table** button in the toolbar, and you're able to add a table with as many rows and columns as your heart desires!

Name	Age	Occupation	Country
John Doe	28	Software Dev	USA
Jane Smith	34	Graphic Designer	UK
Sam Lee	25	Data Analyst	Canada
Emma Brown	30	Teacher	Australia

Flowcharts and Such

PureMark supports the addition of flowcharts and graphs. We call it the Mermaid editor, because the underlying technology is called Mermaid. It's also within the **Insert > Mermaid Diagram** window, and has many customization options in order to make writing Mermaid code a lot easier.

Here's a sample Mermaid chart:

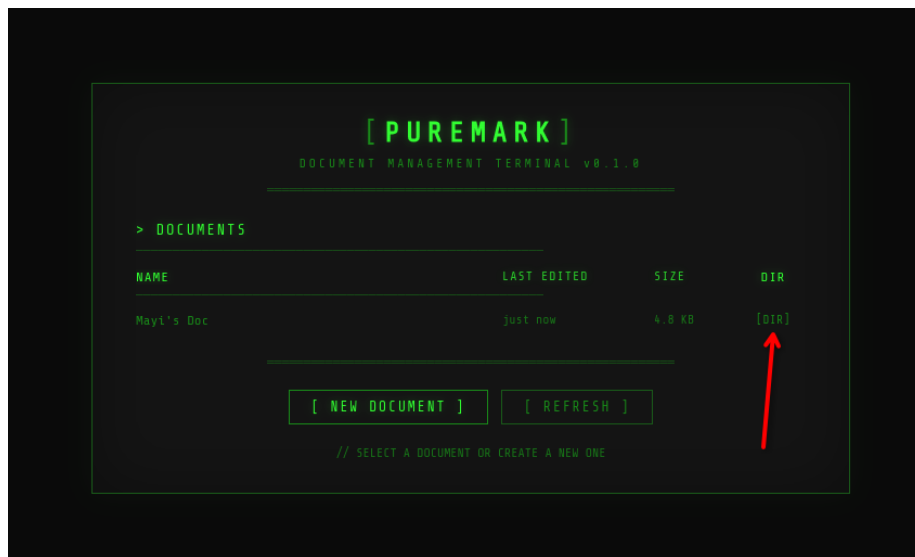

As with the image editor, you're also able to control the “width” of the image relative to the text size. This means that if your chart is too big or too small, not to worry! You can absolutely change that.

Vim Mode for the Powerusers

Yes, there is a Vim mode if you're into that sort of thing. It's in the **Edit > Vim Mode** menu.

Where Stuff is Saved

All your stuff, including backups of old PDF renders, images you've inserted, and Mermaid diagrams you've created, are all saved in your Documents folder. You can also access the folder directly through the main PureMark document selection screen:

Importing Your Existing Google Doc

Google Docs has a wonderful feature called “Copy as Markdown.” You can select your entire doc, right click, and “Copy as Markdown.” PureMark supports Google Docs Markdown, so everything will be seamlessly copied over!

Exporting

You have a few export options within the **Export** tab of the toolbar:

1. PDF – what you see in the PDF preview on the right hand side is what you get as a PDF export
2. Microsoft Word document
3. Standard LaTeX document – for use with Overleaf or any other LaTeX editor
4. Typst document – for use with Typst
